Vi,Java,Ant,Junit 的自学报告

Vi: I have become a vimer for one and a half year, so it maybe nothing for I to say, btw, I used this vim configure: https://github.com/wklken/k-vim.

Java: A totally OOP language, adding many senior features such as reflect, easy to learn cuz it stongly is similar to C++, what I most happy on Java is that it needn't manage pointer.

Ant: Another neat tool, used for managing project, by defining the specific project working procedure such as compile, build and package through editing build.xml.

Junit: Unit test framework, just like other unit test tool, not that special. I found it cool to test with several parameters instead of writing different test repeatedly.
